Helsinki, Finland | Valid right to work in Finland

Professional Summary

Full stack engineer with three years of shipping production systems end to end, usually as the only technical owner, which means I have carried features from a vague business request through architecture, build, deployment, and the 7am phone call when something breaks. My stack is TypeScript, React 19, Next.js, Node.js, Python, and PostgreSQL, with REST and API-centric architecture, Docker, and CI/CD pipelines that gate every merge. On the AI side I have built agent systems into working products: multi-stage orchestration with routing and state, RAG retrieval over pgvector, schema-enforced validation at every boundary, adversarial critique loops, tiered model routing for cost control, and timeout, retry, and provider fallback so a degraded dependency does not take the system down. Concrete results include an operational booking system handling 200+ reservations per month that cut customer booking time by over 50% and replaced a manual phone and email process outright, REST APIs verified against 1,000+ simulated transactions with predictable response times, and winning the Norrin Challenge at the Aalto AI hackathon with a seven-agent compliance system. I am looking for a high-ownership role in a small team where I can shape architecture, work close to the people actually using the software, and see what it does in the real world.

Work Experience

Web Administrator / Technical Support

Jul 2023 – April 2026

Flavour Ventures Oy - Helsinki, Finland

- Sole technical owner of the Pizzala website and supporting systems, taking features from ambiguous business requests through specification, build, deployment, and ongoing operational support with no one else to escalate to.
- Designed and implemented a custom booking and reservation system handling 200+ bookings per month, replacing a manual phone and email process and removing the coordination step that staff had been absorbing by hand.
- Reduced customer booking time by over 50% through a streamlined reservation flow and improved user experience, validated against real customer behaviour rather than assumptions.
- Owned reliability of the website and point-of-sale system in live operational conditions, diagnosing faults mid-service and keeping systems available during peak load, where downtime meant staff falling back to paper.
- Managed digital marketing efforts, including Instagram content and promotions, driving engagement and brand visibility.
- Ran technical operations for large-scale events (150 to 300 guests) for clients including Ubisoft, Metacore, and Gofore, translating client requirements into working setups under live time pressure with no second attempt available.

Software Developer Trainee

Nov 2022 – Dec 2023

Integrify - Helsinki, Finland

- Built a full-stack solo e-commerce project from scratch, including product browsing, cart logic, authentication, and order flow, owning both architecture and delivery.
- Developed and integrated REST APIs that handled 1,000+ simulated transactions during testing, ensuring stable performance and predictable response times.
- Improved frontend performance by 30 to 40% through code optimization, efficient state handling, and UI refinements.
- Practiced deployment, containerization, and cloud hosting workflows, delivering project updates independently through self-directed learning and iterative development.

Awards

Winner of Norrin Challenge | Aalto AI x AI for Good Hackathon | <https://fiveguys1.lovable.app>

Projects

ReguLens | TypeScript, multi-agent orchestration, RAG, Zod specs, Mistral + Llama, pgvector <https://regulensmu.vercel.app>

- Architected a 7-agent orchestration pipeline (Leader, Intake, Extraction, Retrieval, Assessment, Critique, Report) in which each stage produces a distinct persistent artefact, so wrong output can be traced to its source stage rather than debugged as a single opaque failure.
- Enforced typed Zod schemas as the contract at every stage boundary, treating malformed agent output as a spec failure caught at the boundary rather than an error allowed to propagate downstream.
- Routed work across tiered models for cost control, with a cheap leader agent gating whether the expensive reasoning stage runs at all, plus timeout, retry, and provider fallback so degradation upstream does not take the pipeline down.

- Built a two-part verification layer: a deterministic checker that rejects any citation absent from retrieved source material, plus an adversarial critique agent that argues the opposing risk classification and forces revision, which is what catches over-classification.
- Hardened against adversarial input with prompt-injection protection on all user-supplied text and per-session isolation of uploaded documents from the reference corpus, and enforced context scoping so each agent receives only what its stage requires.

Q&A Agent for Local Business | *Next.js, PostgreSQL, Groq, GitHub Actions, Vitest, CodeQL* <https://my-chatbot-appchi.vercel.app>

- Designed a reusable multi-tenant agent framework with strict per-tenant data separation, so no customer content is reachable from another tenant's session.
- Built a full CI/CD pipeline using GitHub Actions with parallel jobs for typechecking, linting, unit testing, and production builds, ensuring code quality and fast feedback on every push.
- Integrated CodeQL static security analysis so findings surface automatically before merge rather than after release.
- Wrote Vitest suites covering route authorization, input validation, and streaming behaviour, treating the security boundary as something tested explicitly rather than assumed.
- Automated deployment to Vercel from the pipeline, bridging the gap between development and live environments.

3C Cleaning Website | *Next.js 14, React, TypeScript, SCSS, i18next* <https://www.3ccleaning.fi>

- Built and deployed a bilingual (FI/EN) customer-facing website serving as the company's primary lead generation channel.
- Migrated the codebase from Create React App to the Next.js App Router, with full bilingual support (FI/EN) via react-i18next across seven pages.
- Configured HTTP security headers and deployed on Vercel with a custom domain.

Education

Bachelor in Business Information Technology
 LAB University of Applied Sciences - Lahti, Finland

Skills

Frontend: React 19, TypeScript, Next.js App Router, TanStack Start/Router, React Native, Tailwind, shadcn/ui, operational dashboard UI

Backend & APIs: Node.js, Python, REST and API-centric architecture, third-party API integration, asynchronous programming, server functions and SSR, C# and .NET fundamentals

Data & Databases: PostgreSQL, SQL, relational data modelling, pgvector, multi-tenant data separation, document ingestion and ETL pipelines

AI & Agent Systems: Multi-agent orchestration and routing, agent tooling, RAG retrieval, structured output validation (Zod), evaluation and critique loops, tiered model routing for cost, multi-provider integration (Mistral, Llama, Groq, OpenAI), MCP client-side experience

Reliability & Observability: Timeout, retry and provider fallback, failure-mode design, integration hardening, production incident diagnosis under time pressure

Infrastructure & DevOps: Docker, CI/CD with GitHub Actions, Vercel, Azure basics, Linux command line, Git/GitHub and GitLab-style workflows

Quality & Security: Vitest unit and route testing, CodeQL static analysis, CI gating on typecheck, lint, test and build, prompt-injection hardening, database-level access control

Ownership & Product: Sole technical ownership of live systems, direct client and stakeholder interaction, turning ambiguous goals into specifications, technical documentation

Languages

Vietnamese - Native
 English - Full professional fluency (C2)
 German - Basic conversational (studied until C1)
 Finnish - Basic (studied until B1)

Certifications

Relational Databases & SQL: Complete Guide for Developers Udemy	Nov 2025
Webservices API Testing with Postman - Complete Guide Udemy	Nov 2025
Linux Command Line: From Zero to Hero Udemy	Dec 2025
